ABSTRACT OF THE DISCLOSURE

method The invention relates to a for preparing polycarboxylic composition, characterized in comprises a stage in which a monosaccharide composition undergoes an electrochemical oxidation treatment carried out in the absence of sodium hypochlorite and in the presence of a) an amine oxide and b) a carbon-based anode.Preferably, said anode is selected from the group a comprising carbon felt and granular active carbon. electrochemical oxidation treatment can be carried advantageously at a pH, preferably of between 11.5 and 14. The inventive method makes it possible to obtain novel products, especially 2-carboxy-2, 3, 4-trihydroxypentanedioicious acid, the salts and derivatives thereof.
